REGSC

USC'S ONLY UNDERGRADUATE CLUB FOR RESEARCH WITHIN REGULATORY SCIENCE

What is Regulatory Science?
Regulatory science involves studying the regulation of pharmaceuticals and medical devices, a field that is highly relevant to everyone from physicians to biomedical engineers. Regulatory science research at USC involves everything from clinical trial monitoring, to looking at the manufacturing process of pharmaceuticals. Students involved in this research have received amazing opportunities to work hand in hand with faculty members and present their research at global conferences, all while maintaining the flexibility to pursue what interests them within the field, a rare combination within STEM-related undergraduate research.
